

## PHP for Beginners - Session 1

### How to Choose a Programming Language

In this session, Jeffrey Way explains how to choose your first programming language and why PHP is a solid choice.

Key points:

၁. Choosing your first language is an important step in becoming a developer.
၂. PHP is ideal if you're interested in building websites, working with WordPress, or using Laravel.
၃. The programming language itself is less important than learning the core programming concepts (like variables, loops, functions, and conditionals).
၄. Once you learn programming fundamentals in PHP, switching to other languages becomes much easier.

The goal of this course is to teach you programming using PHP, while also giving you knowledge that will be valuable no matter which language you use in the future.
